Test Driven Development (TDD), and Refactoring Legacy Code Using C#

Duration: 28 hours

Price: \$900

Prerequisites: C# programming experience and an understanding of object-oriented design principles

Description: This course provides students with hands on experience learning Test Driven Development (TDD) using NUnit and Microsoft's Visual Studio. Students will build unit tests using mocks, fakes, stubs and drivers, and address issues working with databases and other systems. Student will create tests and code that will be more likely to meet and exceed requirements. Code that receives "test coverage" will not break existing systems, because tests are passed before code is checked in.

Students will spend time working with the issues involved in refactoring legacy code, safely cutting into an already deployed system. Students will work on looking for, or creating "seams" to more safely improve code or add features, and work on identifying "code smells" that need attention in a productive system.

Finally, students will explore dependency issues as well as techniques to better understand and improve complex systems.

Comprehensive C# labs provide facilitated hands on practice during the course, allowing students to develop competence and confidence with the new skills being learned.
